Key Results and Interpretations

The findings of the 2014 report have notable implications for both theoretical models and practical decision-making.

Historical Equity Risk Premium

The long-term (1926-2013) real equity risk premium was approximately 6.2%. This figure aligns with historical averages observed in prior decades but has experienced fluctuations influenced by macroeconomic factors.

Recent Period Analysis (1995-2014)

The average premium during this period decreased to around 5.5%, reflecting: Extended low-interest-rate environment. Elevated stock market valuations. Increased investor risk aversion.

Implications for Valuation and Portfolio Management

Lower premiums challenge traditional valuation models that assume higher expected returns. Investors need to adjust their expectations and risk assumptions accordingly. The variability suggests that reliance solely on historical averages may be insufficient; forward-looking estimates and market sentiment should also be integrated.

Comparison with Other Sources

The low-interest-rate environment complicates traditional models. Market Timing and Behavioral Factors Investor sentiment and behavioral biases influence premiums. Periods of exuberance or pessimism can distort historical averages. Policy and Economic Considerations Central bank policies and fiscal stimulus impact market expectations. Demographic shifts and technological advances shape investor risk appetite.
