Let's delve into each of these topics with detailed answers to help you prepare.

Recognizing and Assessing Emergencies

How to Recognize an Emergency

Question: What are the signs that indicate a person may be in an emergency?

Answer: Unresponsiveness or unconsciousness
Breathing difficulties or abnormal breathing patterns
Severe bleeding or visible injuries
Chest pain or discomfort
Sudden weakness, numbness, or paralysis
Signs of shock, such as pale, cool, clammy skin
Confusion, dizziness, or altered mental state
Seizures or convulsions
Any situation where the individual cannot respond or is in distress

Scene Safety and Initial Assessment

Question: What are the steps to assess the scene and the victim safely?

Answer:

- Ensure Scene Safety:** Check for hazards such as traffic, fire, chemicals, or unstable structures.
- Determine Responsiveness:** Gently tap and ask loudly, "Are you okay?"
- Call for Help:** If unresponsive or severely injured, activate emergency services immediately.
- Assess Breathing and Circulation:** Look, listen, and feel for breathing for at least 5 seconds.
- Provide Care as Needed:** Based on assessment, offer appropriate first aid or CPR.

Providing Emergency Care

When to Call Emergency Services

Question: Under what circumstances should you call emergency services immediately?

Answer: Unresponsiveness or unconsciousness
No breathing or abnormal breathing
Severe bleeding resulting in shock
Chest pain or signs of a heart attack
Suspected head, neck, or spine injury
Seizures lasting more than 5 minutes
Signs of stroke (weakness, facial droop, speech difficulty)
Any injury or illness that is life-threatening

How to Approach and Care for Victims

Question: What are the key steps in providing emergency care?

Answer: Ensure scene safety. Gain consent if the victim is responsive. Assess the victim's condition. Provide appropriate first aid or CPR. Monitor the victim until professional help arrives. Reassure and keep the victim

comfortable.

CPR Techniques and Procedures

Basic CPR Steps

Question: What are the steps to perform CPR on an adult?

Answer: Check responsiveness: Tap and shout, "Are you okay?" Call emergency services immediately if unresponsive. Open the airway: Tilt the head back slightly and lift the chin. Check for breathing: Look, listen, and feel for no more than 10 seconds. Begin chest compressions: Place hands on the center of the chest, compress at a rate of 100-120 per minute, pressing down at least 2 inches. Deliver rescue breaths: After 30 compressions, give 2 breaths, each lasting about 1 second, watching for chest rise. Continue cycles of 30 compressions and 2 breaths until help arrives or the victim recovers.

Special CPR Considerations

For children and infants, use appropriate compression depth and hand placement. Use an Automated External Defibrillator (AED) as soon as available.

First Aid for Common Injuries and Illnesses

Managing Bleeding

Question: How do you control severe bleeding?

Answer: Apply direct pressure with a clean cloth or sterile dressing. Elevate the injured limb if possible. Use a tourniquet only if bleeding is uncontrollable and life-threatening. Keep the victim calm and reassured. Seek emergency medical assistance immediately.

Handling Shock

Question: What are the signs of shock, and how should you respond?

Answer: Signs: Pale, cool, clammy skin; rapid breathing; weakness; dizziness; confusion. Response: Keep the victim lying down. Elevate the legs slightly if no head, neck, or spine injury. Keep them warm with blankets or clothing. Reassure and monitor the vital signs. Seek emergency help promptly.

Treating Other Injuries

Burns: Cool with water, cover with sterile dressing. **Fractures:** Immobilize the injured area, avoid moving the victim unnecessarily. **Choking:** Encourage coughing; perform abdominal thrusts if necessary.

Special Considerations for Divers and Non-Divers

Diving-Related Emergencies

Question: What are common diving emergencies and their first aid responses?

Answer: Decompression Sickness: Administer oxygen, call emergency services. Air Embolism: Provide oxygen immediately, monitor breathing. Barotrauma: Assist with oxygen and seek medical attention.

Non-Divers Emergency Response

The principles of emergency response apply universally, with adaptations for specific situations, such as allergic reactions, strokes, or heart attacks.

What is the first step in responding to an unconscious person?
 A) Call emergency services
 B) Check for responsiveness and breathing
 C) Begin CPR immediately
 D) Administer oxygen
Correct Answer: B) Check for responsiveness and breathing
Explanation: The initial response involves assessing the victim's responsiveness and airway, breathing, and circulation (ABCs). Only after confirming unresponsiveness should emergency protocols such as calling for help or starting CPR be initiated.

Which of the following is NOT a sign of stroke?
 A) Sudden weakness or numbness
 B) Sudden severe headache
 C) Fever and chills
 D) Sudden confusion or difficulty speaking
Correct Answer: C) Fever and chills

When administering emergency oxygen, what flow rate is recommended for a non-rebreather mask?
 A) 6-8 liters per minute
 B) 10-15 liters per minute
 C) 4 liters per minute
 D) 20 liters per minute
Correct Answer: B) 10-15 liters per minute
Explanation: A non-rebreather mask generally requires a flow rate within this range to deliver effective oxygen concentrations.

Common Misconceptions and Clarifications

Question about the sequence of CPR steps: Students often confuse the order of compressions and rescue breaths; the correct sequence emphasizes "CAB" (Circulation, Airway, Breathing).

Use of oxygen for non-life-threatening situations: Some believe oxygen should always be administered; however, it is specifically indicated for certain conditions, such as difficulty breathing or unconsciousness.

Common PADI Dive Theory Exam Questions and Answers

Sample Question 1: What is Boyle's Law?

Question: Boyle's Law states that at constant temperature, the volume of a gas is

inversely proportional to its pressure. How does this principle relate to diving? Answer: As a diver descends and pressure increases, the volume of air in the lungs, buoyancy compensator, and other gas-filled spaces decreases. Conversely, during ascent, the volume increases, which can cause issues like lung over-expansion injuries if not managed properly.

Sample Question 2: Why is it important to perform a safety stop during a dive? Question: What is the purpose of a safety stop at about 15 feet (5 meters) for 3 minutes? Answer: The safety stop allows excess nitrogen to off-gas from the body, reducing the risk of decompression sickness. It provides an additional safety margin, especially after deep or extended dives.

Sample Question 3: What are the signs of nitrogen narcosis? Question: Which of the following is a common symptom of nitrogen narcosis? A) Dizziness and impaired judgment B) Increased alertness C) Shortness of breath D) Ear pain Answer: A) Dizziness and impaired judgment
