Sample Fluid Power Practice Problems with Answers

Problem 1: Hydraulic Force Calculation
 Given: A hydraulic cylinder has a piston diameter of 4 inches. The system operates at a pressure of 1500 psi.
 Question: What is the force exerted by the cylinder?
 Solution:
 Convert diameter to radius: Radius (r) = 4 inches / 2 = 2 inches
 Calculate the area (A): $(A = \pi r^2 = \pi \times (2)^2 = 12.57 \text{ in}^2)$
 Use the formula for force: $(F = P \times A)$
 Convert pressure to psi (pounds per square inch): $(F = 1500 \text{ psi} \times 12.57 \text{ in}^2 = 18,855 \text{ lbs})$
 Answer: The hydraulic cylinder exerts approximately 18,855 pounds of force.

Problem 2: Flow Rate in Pneumatic System
 Given: A pneumatic system has a compressor delivering air at a pressure of 100 psi and a flow rate of 10 CFM (cubic feet per minute).
 Question: How much air volume flows through the system per minute?
 Solution: Since flow rate is directly given:
 Flow rate = 10 CFM
 Answer: The system delivers 10 cubic feet of air per minute.

Problem 3: System Efficiency
 Given: A hydraulic system consumes 200 Watts of power but produces a useful work output of 150 Watts.
 Question: What is the efficiency of the system?
 Solution: Efficiency (η) is calculated as: $(\eta = \frac{\text{Useful Power Output}}{\text{Power Input}} \times 100)$
 $(\eta = \frac{150}{200} \times 100 = 75\%)$
 Answer: The system has an efficiency of 75%.

Common Questions and Sample Answers in PLTW Unit 3

Below are typical questions students might encounter, along with detailed explanations and

sample answers to clarify the reasoning process.

Question 1: Calculating Gear Ratios If a gear train has a gear A with 20 teeth and gear B with 60 teeth, what is the gear ratio? How does this ratio affect the output speed?

Answer: Gear ratio = Number of teeth on driven gear / Number of teeth on driver gear = $60 / 20 = 3:1$.

Effect on speed: The gear ratio of 3:1 means that for every 3 rotations of gear A (driver), gear B (driven) completes 1 rotation.

Implication: The output speed decreases by a factor of 3, but torque increases proportionally. Understanding this helps students see how gear ratios influence the trade-off between speed and torque in mechanical systems.

Question 2: Mechanical Advantage of a Lever A lever is used to lift a 200 N weight. The effort applied at the other end of the lever is 50 N. What is the mechanical advantage of the lever?

Answer: Mechanical advantage (MA) = Load force / Effort force = $200 \text{ N} / 50 \text{ N} = 4$.

Interpretation: The lever multiplies input force by a factor of 4, making it easier to lift heavy loads with less effort. This reinforces the concept that simple machines like levers provide mechanical advantage, reducing the effort needed to perform work.

Question 3: Identifying the Type of Mechanism Given a diagram of a linkage that converts rotary motion into oscillating motion, identify the type of mechanism.

Answer: Likely a four-bar linkage or oscillating crank, depending on specific linkages.

Explanation: Four-bar linkages are common in converting rotary motion into linear or oscillating motion, used in various mechanical devices like windshield wipers or pistons. Students should analyze the linkage diagram to identify pivot points, link lengths, and the motion path.

Question 4: Calculating Power in a Mechanical System A motor applies a force of 50 N to move a mechanism at a velocity of 2 m/s. What is the power output?

Answer: Power (P) = Force (F) $\times$ Velocity (v) = $50 \text{ N} \times 2 \text{ m/s} = 100 \text{ Watts}$.

Significance: Power measures how quickly work is done; understanding this helps evaluate system efficiency.

Example Problem 1: Hydraulic Cylinder Force Calculation

Problem: A hydraulic system uses oil at a pressure of 2000 psi to operate a cylinder with a piston diameter of 4 inches. What is the force exerted by the cylinder?

Solution:

- Convert diameter to radius: $\text{radius } r = \text{diameter} / 2 = 4 \text{ in} / 2 = 2 \text{ in}$
- Calculate the area of the piston: $\text{Area } A = \pi r^2 = 3.1416 (2 \text{ in})^2 = 3.1416 \cdot 4 = 12.5664 \text{ in}^2$
- Convert pressure from psi to pounds per square inch: Pressure $P = 2000 \text{ psi}$
- Calculate force: $\text{Force } F = P \cdot A = 2000 \text{ psi} \cdot 12.5664 \text{ in}^2 = 25,132.8 \text{ pounds}$

Answer: The hydraulic cylinder exerts approximately 25,133 pounds of force.

Example Problem 2: Air Flow Rate in Pneumatic System

Problem: A pneumatic system has a compressed air source operating at 100 psi. If the air flows through a 1/2-inch diameter pipe, what is the flow rate in cubic feet per minute (CFM)? Assume the air behaves as an ideal gas at standard conditions.

Solution:

- Calculate the cross-sectional area of the pipe: $\text{Radius } r = 0.5 \text{ in} / 2 = 0.25 \text{ in} = 0.0208 \text{ ft}$
- $\text{Area } A = \pi r^2 = 3.1416 (0.0208 \text{ ft})^2 = 3.1416 \cdot 0.000433 = 0.00136 \text{ ft}^2$
- Use Bernoulli's principle or flow equations for incompressible flow (simplified): $\text{Flow velocity } v = \sqrt{(2 \cdot P \cdot \text{pressure head}) / \text{density}}$
- For compressed air, a simplified approach uses flow charts or empirical formulas; for this example, assume an approximate velocity of 40 ft/sec under typical conditions.
- Calculate flow rate: $Q = A \cdot v = 0.00136 \text{ ft}^2 \cdot 40 \text{ ft/sec} = 0.0544 \text{ ft}^3/\text{sec}$
- Convert to CFM: $1 \text{ ft}^3/\text{sec} = 60 \text{ CFM}$
- $Q = 0.0544 \cdot 60 = 3.26 \text{ CFM}$

Answer: The flow rate is approximately 3.26 CFM.
